## Chapter 1

# Clustering - Numerical Linear Algebra Challenge 2

This project explores spectral clustering techniques applied to a social network graph, using numerical linear algebra tools. The main objective is to identify communities within a network by leveraging the Fiedler vector, i.e., the eigenvector corresponding to the second smallest eigenvalue of the graph Laplacian.

## Chapter 4

# Namespace Documentation

### 4.1 Constants Namespace Reference

#### Variables

- const std::string **TASK1\_GRAPH\_FILE** = std::string("./media/matrices/task1\_graph.mtx")
- const std::string **SOCIAL\_GRAPH\_FILE** = std::string("./media/matrices/social.mtx")
- const std::string **SMALL\_MTX\_FILE** = std::string("./media/matrices/test\_mats/small.mtx")
- const std::string **SMALL\_EIGEN\_VEC\_FILE** = std::string("./media/matrices/test\_mats/small\_vector\_eig.mtx")
- const std::string **SMALL\_LIS\_VEC\_FILE** = std::string("./media/matrices/test\_mats/small\_vector\_lis.mtx")
- constexpr Types::Real **eps** = 1.0e-15

#### 4.1.1 Detailed Description

Contains constants used within this library

### 4.2 LisIO Namespace Reference

#### Functions

- bool [load\\_matrix](#) (const std::string &filename, Types::Sparse &matrix)
- bool [load\\_vector](#) (const std::string &filename, Types::Vector &vector)
- bool [load\\_eigenpairs](#) (const std::string &vec\_filename, const std::string &eval\_filename, std::vector<Types::EigenPair> &eigenpairs)
- bool [save\\_matrix](#) (const std::string &filename, const Types::Sparse &matrix)
- bool [save\\_vector](#) (const std::string &filename, const Types::Vector &vector)

#### 4.2.1 Detailed Description

Contains functions to load and store mtx files that are immediately readable with LIS

## 4.2.2 Function Documentation

### 4.2.2.1 load\_eigenpairs()

```
bool LisIO::load_eigenpairs (
    const std::string & evec_filename,
    const std::string & eval_filename,
    std::vector< Types::EigenPair > & eigenpairs)
```

Load two LIS generated mtx file into a vector of EigenPairs

#### Parameters

|                      |                                                                    |
|----------------------|--------------------------------------------------------------------|
| <i>evec_filename</i> | The LIS generated mtx file containing the eigenvectors             |
| <i>eval_filename</i> | The LIS generated mtx file containing the eigenvalues              |
| <i>eigenpairs</i>    | A vector of EigenPairs to be filled, this will clear previous data |

#### Returns

true if file readings were successful, false otherwise

### 4.2.2.2 load\_matrix()

```
bool LisIO::load_matrix (
    const std::string & filename,
    Types::Sparse & matrix)
```

Load a LIS generated mtx file into a Eigen Sparse matrix

#### Parameters

|                 |                                                         |
|-----------------|---------------------------------------------------------|
| <i>filename</i> | The LIS generated mtx file containing the sparse matrix |
| <i>matrix</i>   | The matrix to be filled, this will clear previous data  |

#### Returns

true if file reading was successful, false otherwise

### 4.2.2.3 load\_vector()

```
bool LisIO::load_vector (
    const std::string & filename,
    Types::Vector & vector)
```

Load a LIS generated mtx file into a Eigen VectorXd

## Parameters

|                 |                                                        |
|-----------------|--------------------------------------------------------|
| <i>filename</i> | The LIS generated mtx file containing the vector       |
| <i>vector</i>   | The vector to be filled, this will clear previous data |

## Returns

true if file reading was successful, false otherwise

**4.2.2.4 save\_matrix()**

```
bool LisIO::save_matrix (
    const std::string & filename,
    const Types::Sparse & matrix)
```

Save a Eigen Sparse into a file immediately readable from LIS

## Parameters

|                 |                                                                                     |
|-----------------|-------------------------------------------------------------------------------------|
| <i>filename</i> | The mtx file to be filled with LIS readable data, this will delete previous content |
| <i>matrix</i>   | The matrix to be saved                                                              |

## Returns

true if file writing was successful, false otherwise

**4.2.2.5 save\_vector()**

```
bool LisIO::save_vector (
    const std::string & filename,
    const Types::Vector & vector)
```

Save a Eigen VectorXd into a file immediately readable from LIS

## Parameters

|                 |                                                                                     |
|-----------------|-------------------------------------------------------------------------------------|
| <i>filename</i> | The mtx file to be filled with LIS readable data, this will delete previous content |
| <i>vector</i>   | The vector to be saved                                                              |

## Returns

true if file writing was successful, false otherwise

## 4.3 MtxIO Namespace Reference

## Functions

- bool [load\\_matrix](#) (const std::string &filename, Types::Sparse &matrix)
- bool [load\\_vector](#) (const std::string &filename, Types::Vector &vector)
- bool [save\\_matrix](#) (const std::string &filename, const Types::Sparse &matrix)
- bool [save\\_vector](#) (const std::string &filename, const Types::Vector &vector)

### 4.3.1 Detailed Description

Contains functions to load and store mtx files that are immediately readable with Eigen

### 4.3.2 Function Documentation

#### 4.3.2.1 load\_matrix()

```
bool MtxIO::load_matrix (
    const std::string & filename,
    Types::Sparse & matrix)
```

Load matrix in mtx file into an Eigen Sparse

##### Parameters

|                 |                                                        |
|-----------------|--------------------------------------------------------|
| <i>filename</i> | The mtx file containing the sparse matrix              |
| <i>matrix</i>   | The matrix to be filled, this will clear previous data |

##### Returns

true if file reading was successful, false otherwise

#### 4.3.2.2 load\_vector()

```
bool MtxIO::load_vector (
    const std::string & filename,
    Types::Vector & vector)
```

Load vector in mtx file into an Eigen VectorXd

##### Parameters

|                 |                                                        |
|-----------------|--------------------------------------------------------|
| <i>filename</i> | The mtx file containing the vector                     |
| <i>vector</i>   | The vector to be filled, this will clear previous data |

##### Returns

true if file reading was successful, false otherwise

#### 4.3.2.3 save\_matrix()

```
bool MtxIO::save_matrix (
    const std::string & filename,
    const Types::Sparse & matrix)
```

Save an Eigen Sparse into mtx file immediately readable by Eigen

**Parameters**

|                 |                                                              |
|-----------------|--------------------------------------------------------------|
| <i>filename</i> | The mtx file to be filled, this will delete previous content |
| <i>matrix</i>   | The matrix to be saved                                       |

**Returns**

true if file writing was successful, false otherwise

**4.3.2.4 save\_vector()**

```
bool MtxIO::save_vector (
    const std::string & filename,
    const Types::Vector & vector)
```

Save an Eigen VectorXd into a mtx file immediately readable by Eigen

**Parameters**

|                 |                                                              |
|-----------------|--------------------------------------------------------------|
| <i>filename</i> | The mtx file to be filled, this will delete previous content |
| <i>vector</i>   | The vector to be saved                                       |

**Returns**

true if file writing was successful, false otherwise

**4.4 Types Namespace Reference****Typedefs**

- using **Real** = double
- using **Index** = Eigen::Index
- using **Sparse** = Eigen::SparseMatrix<Real, Eigen::RowMajor>
- using **Full** = Eigen::MatrixXd
- using **Vector** = Eigen::VectorXd
- using **EigenPair** = std::pair<Vector, Real>
- using **OrderEigenVector** = std::vector<std::pair<int, Real>>

**4.4.1 Detailed Description**

Contains types used within this library

A vector to be ordered, such that if element i is (j, value) then value was moved form position j to i

### Functions

- Types::Real [frobenius\\_norm](#) (const Types::Sparse &matrix)
- Types::Vector [row\\_sums](#) (const Types::Sparse &matrix)
- Types::Sparse [make\\_diag\\_matrix](#) (const Types::Vector &vector)
- Types::Sparse [make\\_laplacian](#) (const Types::Sparse &matrix)
- bool [is\\_symmetric](#) (const Types::Sparse &matrix)
- bool [is\\_positive\\_definite](#) (const Types::Vector &eigenvals)
- bool [is\\_semi\\_positive\\_definite](#) (const Types::Vector &eigenvals)

### 5.5.1 Function Documentation

#### 5.5.1.1 frobenius\_norm()

```
Types::Real frobenius_norm (
    const Types::Sparse & matrix)
```

Computes the Frobenius norm of a Sparse

**Parameters**

|               |                                   |
|---------------|-----------------------------------|
| <i>matrix</i> | The matrix to compute the norm of |
|---------------|-----------------------------------|

**Returns**

the Frobenius norm

**Note**

Use the Eigen norm() method instead

**5.5.1.2 is\_positive\_definite()**

```
bool is_positive_definite (
    const Types::Vector & eigenvals)
```

Check if a matrix is Positive Definite given an Eigen VectorXd containing the eigenvalues

**Parameters**

|                  |                          |
|------------------|--------------------------|
| <i>eigenvals</i> | the eigenvalues to parse |
|------------------|--------------------------|

**Returns**

true if all eigenvalues are strictly positive

**Note**

if an eigenvalue is within Constants::eps distance from 0 it is considered to be 0

**5.5.1.3 is\_semi\_positive\_definite()**

```
bool is_semi_positive_definite (
    const Types::Vector & eigenvals)
```

Check if a matrix is Positive Semi Definite given an Eigen VectorXd containing the eigenvalues

**Parameters**

|                  |                          |
|------------------|--------------------------|
| <i>eigenvals</i> | the eigenvalues to parse |
|------------------|--------------------------|

**Returns**

true if all eigenvalues are greater or equal to 0

**Note**

if an eigenvalue is within Constants::eps distance from 0 it is considered to be 0

**5.5.1.4 is\_symmetric()**

```
bool is_symmetric (
    const Types::Sparse & matrix)
```

Check if a sparse matrix is symmetric

**Parameters**

|               |                                     |
|---------------|-------------------------------------|
| <i>matrix</i> | The matrix to check the symmetry of |
|---------------|-------------------------------------|

**Returns**

true if the marix is symmetric, false otherwise

**5.5.1.5 make\_diag\_matrix()**

```
Types::Sparse make_diag_matrix (
    const Types::Vector & vector)
```

Generate a diagonal sparse matrix D from a vector such that  $D_{ii} = v_i \forall i \in \{0, \dots, n-1\}$

**Parameters**

|               |                                                |
|---------------|------------------------------------------------|
| <i>vector</i> | The vector to compute the diagonal matrix from |
|---------------|------------------------------------------------|

**Returns**

a diagonal matrix as per description

**5.5.1.6 make\_laplacian()**

```
Types::Sparse make_laplacian (
    const Types::Sparse & matrix)
```

Compute the Laplacian of a matrix

**Parameters**

|               |                                        |
|---------------|----------------------------------------|
| <i>matrix</i> | The matrix to compute the Laplacian of |
|---------------|----------------------------------------|

**Returns**

The Laplacian matrix

**5.5.1.7 row\_sums()**

```
Types::Vector row_sums (
    const Types::Sparse & matrix)
```

Computes a vector v from a matrix A such that  $v_i = \sum_{j=0}^{m-1} A_{ij} \forall i \in \{0, \dots, n-1\}$

#### Parameters

|               |                                       |
|---------------|---------------------------------------|
| <i>matrix</i> | The matrix to compute the vector from |
|---------------|---------------------------------------|

#### Returns

a vector as per description
